PREFACE

The economic accounts estimates are prepared annually by the Economic and Demographic Models Unit of the Alberta Bureau of Statistics. This publication presents the 1984 final estimates. As ongoing users of economic accounts data are aware, "final estimates" are subject to minor revisions, for several years, since some input data are not finalized until after the reference year. Revisions to earlier years are also incorporated in this report.

In preparing these estimates the Bureau relies heavily on input data from Statistics Canada and other provincial government departments. We would like to thank Statistics Canada and the various departments for their cooperation and assistance in providing us with data.

Enquiries concerning the publication or requests for additional copies should be directed to:

ALBERTA ECONOMIC ACCOUNTS

ALBERTA ECONOMIC ACCOUNTS

INTRODUCTION

The Alberta Economic Accounts is an annual publication produced by the Economic and Demographic Models Unit of the Alberta Bureau of Statistics. The format of the publication and the methods used to estimate the values are similar to the National Income and Expenditure Accounts produced by Statistics Canada, except the provincial accounts are presented in less detail.

Basically, the provincial accounts are prepared from a number of sources, including Statistics Canada and other provincial government departments. Whenever these sources revise their data, or produce new estimates, the economic accounts are revised. The data presented incorporate the latest economic figures available and update the preliminary estimates of GDP released in September, 1985.

The publication is separated into three main parts. The first part provides a brief description of how the economy performed in 1984 and then outlines the basic concepts of economic accounts and their measurement. The second section presents the data, including the consolidated tables which provide measures of total economic production, in both current and constant dollars, and the sector tables which show the flows of income and outlay among the various sectors of the economy. The special detail tables and the quarterly data are included to provide more comprehensive data to those users who require these details. The final section provides brief definitions or explanations of terms which appear throughout the accounts.

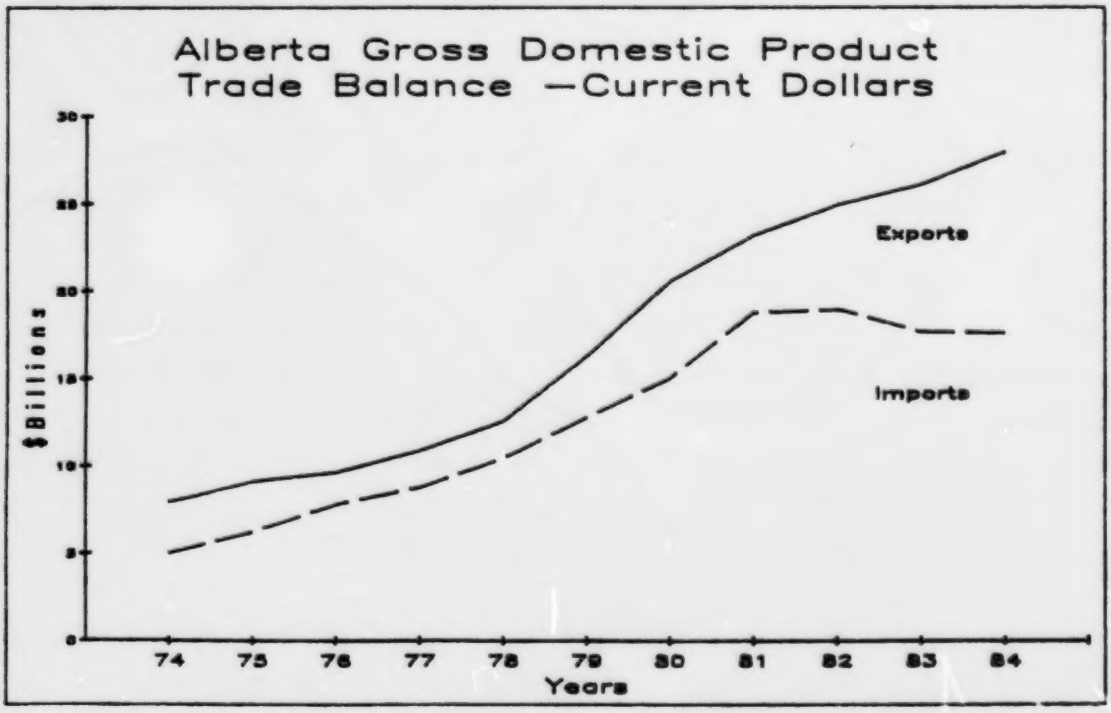
The publication does not include the government supplementary tables, with details of subsidies, taxes, government investment income, transfers, and revenues and expenditures for all levels of government. These data, which

were included in publications prior to 1983, can be obtained from ASIST.[1] Data for 1984 will be available in August, 1986, when revisions are completed in conjunction with the public accounts data usually released in the spring.

THE ALBERTA ECONOMY IN 1984

In 1984, the Alberta economy grew in both nominal and real terms. In nominal terms, Alberta's gross domestic product (GDP) rose to a level of $57.5 billion, up 4.8 percent over 1983. After adjusting for inflation, in real terms, this represented a growth of 1.4 percent. The rate of inflation, as measured by the change of the GDP price deflator was 3.4 percent, the lowest level since 1965.

The improved economic growth, compared with the past two years, was primarily due to a larger trade balance as exports increased 7.1 percent while imports were virtually unchanged. This resulted in a current dollar trade surplus of $10.4 billion, up 22.5 percent over the 1983 level (see graph below).



[1] Alberta Statistical Information System

Additional summary comments for the outlay account:

- Personal expenditure grew by 3.6 percent in current dollars as a result of an 11.9 percent jump in consumer expenditures on durable goods. In real terms, total expenditures went up 1.0 percent after declining in 1982 and increasing only one-half percent in 1983. Real personal expenditures, at $8.5 billion in 1984, surpassed their previous high of $8.4 billion, recorded in 1981.

- Sales to government, a measure of the level of current operating expenditures for all levels of government, increased by 3.9 percent in current dollars, the lowest growth rate since the late fifties. The increase was largely the result of a 2.8 percent increase in total wages and salaries paid to government employees. In real terms, expenditures declined 0.1 percent, the first recorded drop since 1961 (the earliest year constant dollar data are available).

- Investment activity, the sum of construction and machinery and equipment, declined for the third consecutive year. Overall, however, the 1984 decline of 12.6 percent in current dollars was considerably smaller than the 24.6 percent drop experienced in 1983. By component, the 1984 changes were as follows (1983 values in brackets): non-residential construction -7.9 percent (-25.5 percent); machinery and equipment -8.3 percent (-21.9 percent); and residential construction -43.0 percent (-26.5 percent).

Summary of the current dollar income account:

- Corporation profits registered the highest rate of growth of all income components at 14.6 percent, although this rate was down from the 1983 growth of 26.8 percent.

- Wages and salaries, the largest component of the income side, increased marginally with a growth of 1.8 percent, which was up from the 1983 increase of 1.5 percent.

- Farm income increased by 1.6 percent in 1984. This increase, however, represents accrued farm income that incorporates an 88.0 percent increase due to an adjustment on grain transactions (see definitions for an additional explanation). Actual farm net income recorded a decline of 22.1 percent.

- Interest and miscellaneous investment income grew by 8.5 percent, which represents an improvement over the 1983 growth of 4.8 percent.

For further details, the 1983 and 1984 levels and percent changes are presented in the following Summary Table.

SUMMARY TABLE
ALBERTA GROSS DOMESTIC PRODUCT AND
SELECTED COMPONENTS, 1983-1984 (MILLIONS OF DOLLARS)

OUTLAY ACCOUNT	CURRENT DOLLARS			CONSTANT 1971 DOLLARS		
	1983	1984	PERCENT CHANGE	1983	1984	PERCENT CHANGE

NOTE: Selected components, numbers do not add to total GDP; see detailed tables for a complete listing of components

ECONOMIC ACCOUNTS - CONCEPTS AND MEASUREMENT

1. What are Economic Accounts?

A commercial enterprise monitors its performance by a set of accounts or financial statements, which record the details in dollar terms of the transactions in which it has participated over a period of time. Similarly, the economic performance of a region can be measured by economic accounts, which record the aggregated values of transactions of all persons, businesses, governments and institutions.

The economic accounts aggregate statistics of general interest, such as gross domestic product, personal income and personal consumption. In addition the economic accounts are also used for current economic analysis, short-term forecasting, analysis of the sources of economic growth, construction of econometric models, and structural analysis (i.e., composition of production by industry, composition of demand, or the role of the government sector in the economy, etc.). The accounts are also useful in the formulation of public and private policy decisions.

2. Gross Domestic Product vs. Gross National Product

Alberta's economic growth can be measured by gross domestic product (GDP), which indicates the value of total production within the geographical boundaries of the province (Tables 1 and 2). This should not be confused with the provincial equivalent of the gross national product (GNP), often called the gross provincial product, which would be the value of total production attributable to the residents of Alberta, regardless of where that production takes place. The GDP is a measure of economic activity and not a pure measure of economic well-being of the residents. It measures total income accruing to the factors of production (labour and capital) due to economic activity within the province; however, it does not indicate whether these incomes are being collected

by the residents of Alberta. Thus, GDP at market prices plus investment income received from non-residents less investment income paid to non-residents equals GNP at market prices. Since estimates of investment income received from and paid to non-Albertan Canadians can not be calculated it is not possible to estimate provincial GNP at this time.

3. Measurement: Income and Expenditure Approaches

The gross domestic product of Alberta has been measured by two methods. The first method is the Income Approach, which sums the earnings of the factors of production plus capital consumption allowances plus indirect taxes less subsidies. This method focuses directly on the concept of value added. The value added at a given stage of the production process is calculated by subtracting the value of intermediate goods and services from the revenue arising from the production of goods and services at that stage. The difference so determined will be equal to the value, at that stage of the production process, of payments for labour, profits, depreciation and indirect taxes (such as, federal sales tax) less subsidies received. When summed for the economy as a whole, these amounts provide an estimate of the GDP of Alberta (Table 2, Consolidated Income Account). Capital consumption allowances are used as a proxy for depreciation because depreciation cannot be measured directly.

The Consolidated Outlay Account (Table 2) illustrates measurement of the GDP by the second method, namely, the Expenditure Approach. This method sums the final purchases of goods and services by Albertans plus the value of physical change in inventories plus exports less imports. All production must eventually be sold, either for current consumption or for capital formation. Some commodities are sold several times as they pass through the production process, with each producer increasing the dollar value of them. Thus, when they are sold to the ultimate consumer, their sales value should represent the total value that has been added during production. An estimate of total production can be obtained by summing these total final sales (including exports), adding inventory changes, and subtracting amounts paid for imports to remove the amount of value added before they entered Alberta.

Theoretically, these two methods should produce the same result, however, for statistical reasons they do not. The difference between the two methods is reflected in the residual component, which is more fully explained in the "Definition of Terms" section at the back of this publication.

4. Current Dollar vs. Constant (Real) Dollar Estimates

Total product or value added (that is, production of finished goods and services) can be separated into a quantity component (the number of units of various commodities) and a price component. The price applied to the goods and services can either be the current market price, or the market price which prevailed in some earlier year. For the latter, base-year prices are used to measure the value of production for each year. When using the same base-year prices production is said to be measured in "constant" dollars. Measuring the value of production in this way removes the component of growth that is due to price changes. This approach, which discounts inflation, is also often referred to as presenting a picture or measure of "real" value or growth in GDP. Annual estimates of GDP in constant dollars are presented in Table 3. (Quarterly deflators are unavailable at this time).

The basic method used to calculate constant dollar GDP is to deflate each of the components of the expenditure side by its corresponding price index. This process is carried out in two different stages. The period 1961 to 1970 is deflated using 1961 as a time base, while 1971 to the current year uses 1971 as a base. The first period is then arithmetically converted to the 1971 base. The reasons for using this method are twofold. Firstly, this is the methodology used in the National Accounts. Using the same methodology facilitates comparisons between Alberta and Canada. Secondly, prices obtained for the period 1961 to 1970 are weighted differently than post-1971 prices. Therefore, deflation using the 1961 base for these years will retain the constant dollar changes for this period. Rebasing of the 1961 to 1970 period is done at published levels. In some cases where rebased constant dollar components are

aggregated to rebased published totals, some discrepancies occur. These are shown in the constant dollar tables as the "Adjusting Entries".

5. Data Revisions

Changes to the series presented in these accounts occur whenever new sources of data or revised data series become available; or when new methods of estimation are developed that provide more accurate results. In this set of accounts, changes have been made to GDP back to 1971 as a result of changes in the methodology used to estimate exports and imports. Imports are calculated by using the 1974 Alberta Input-Output tables to estimate the import content of the final domestic demand components, namely sales to persons, sales to government, and gross fixed capital formation, and of the intermediate inputs used in the production of goods and services. This method is slightly modified from that incorporated last year, as was the method to estimate the value for exports of grains. These changes led to minor revisions to both the current and constant dollar estimates of exports and imports.

The method used to estimate the quarterly distribution of non-residential construction has also been modified from last year by breaking out oil and gas wells data for employment, average weekly hours worked, and average weekly earnings. Last year, this was included under other engineering. This change also affected both the current and constant dollar series.

PERSONAL INCOME BY CENSUS DIVISION

Table 17 is included in this publication to provide more geographical detail to users. It presents estimates of personal income by census division for the period 1973 to 1983. This table replaces the separate report that presented census division estimates in 1979 and 1980. Although we estimate personal income at the census division level, it is not possible to estimate GDP for census divisions since there are numerous components for which sub-provincial data are not available.

Briefly, the methodology used to calculate the figures in this table was to allocate each of the components of personal income to census divisons using data obtained from Alberta personal income tax tapes. There is an eighteen month lag in receiving these data so that estimates are only available up to 1983 for this table.

While only the totals for personal income are presented, data on its components are available. Personal income per capita by census division is available on ASIST, while other detailed tables as well as further notes on the methodology (which were published in the 1979 and 1980 Personal Income by Census Division reports) are available upon request.

SECTOR ACCOUNTS

As opposed to the production measures described above, which represent the total value of production for Alberta, the concept of presenting sector accounts is to show the flows of income and outlay between the various sectors of the economy. The key difference between sector tables and the consolidated tables is that the sector tables show transfers of income and expenditure between sectors. These transfers do not necessarily represent production, however, they show the redistribution of wealth. (See the Definition of Terms section on Current Transfers). The sectors are defined as follows:

The Personal Sector comprises the transactions of all individuals, unincorporated businesses and private non-profit organizations resident in Alberta (see Table 7).

The Government Sector includes the transactions of all government departments and agencies at the federal, provincial, and municipal levels. Government enterprises which are profit oriented are included in the business sector. The government sector has included hospitals since 1961. The government sector data (Table 8) combines the activities of all levels of government,

including federal, provincial and local. It should be noted that the government sector table does not necessarily reflects government's economic transactions as they relate to economic accounting practices. These numbers thus differ from those presented in the "public accounts" of the different levels of government.

The Business Sector (Table 9) consists of all corporate and government business enterprises resident in Alberta. Problems arise due to the presence of multi-provincial corporations; however, a concerted effort has been made to resolve difficulties in this area using available data on an establishment basis.

The Non-Resident Sector for Alberta includes the transactions of goods and services between residents of Alberta and all persons, governments and business enterprises located outside the province. There is no specific table of data for this sector. Total transactions are shown as exports and imports in the consolidated outlay account.

DEFINITION OF TERMS

DEFINITION OF TERMS USED IN THE ALBERTA ECONOMIC ACCOUNTS

INTRODUCTION

This section provides a short definition or explanation of terms which appear in the accounts. Additional detail can be obtained from either the U.N. System of National Accounts or the National Income and Expenditure Accounts (NIEA) of Canada. Both sources are identified below:

The following abbreviations are used in this section:

1. NIEA — Dominion Bureau of Statistics. National Income and Expenditure Accounts, 1926-1956 Ottawa: Queen's Printer, 1962. Cat. No. 13-502.

2. NIEA, Vol. 1 — Statistics Canada. National Income and Expenditure Accounts, Volume 1 (The Annual Estimates, 1926- 1974). Ottawa: Information Canada, 1976. Cat. No. 13-531

3. NIEA, Vol. 2 — Statistics Canada. National Income and Expenditure Accounts, Volume 2 (The Quarterly Estimates, 1947- 1974). Ottawa: Information Canada, 1976. Cat. No. 13-533.

4. NIEA, Vol. 3 — Statistics Canada. National Income and Expenditure Accounts, Volume 3 (A Guide to the National Income and Expenditure Accounts, Definitions - Concepts - Sources - Methods). Ottawa: Information Canada, 1975. Cat. No. 13-549E.

5. S.C. — Statistics Canada. When followed by a number, it refers to a specific Statistics Canada catalogue.

6. SNA — United Nations. A System of National Accounts. Studies in Methods, Series F No. 2 Rev. 3. New York: United Nations, 1968.

Adjustment on grain transactions:
The Canadian Wheat Board (CWB) makes payments to producers in the current year on crops delivered in previous years. Since the income Account is a measure of the earnings arising out of current production rather than actual cash receipts, adjustments have to be made. A second portion of this adjustment allows for the fact that the earnings of the CWB are calculated on the basis of the change in book values of inventories, whereas the required valuation of inventories for the Accounts is the value of physical change. Negative values occur when CWB payments to farmers in a given year are higher than the actual value of grain produced in that year. That is, payments have been made for grain delivered in previous years.

Capital assistance:
An expenditure item of federal and provincial governments, capital assistance consists of grants to incorporated and unincorporated businesses with the aim of assisting construction of new facilities or the acquisition of new production machinery and equipment.

Capital consumption allowances:
Applicable to both government and business, this item has two components which at present are not completely separable: (1) an allowance for consumption of fixed capital (depreciation allowance) in the economy, and (2) various valuation adjustments arising from differences in the concepts of income and capital consumption as reflected in business accounting records and the corresponding concepts used in the National Accounts. The item is adjusted by adding capital outlays charged to current expense plus the claim portion of business and residential insurance and subtracting non-capital outlays charged to the capital account.

Corporation profits:
This component in the accounts is calculated before deduction of income and excess profits taxes, depletion allowances, charitable donations, and before payments of dividends to non-residents. Due to the complexity of this item a more complete description and derivation of corporate profits can be found in National Income and Expenditure Accounts, Chapter 7, Statistics Canada, 1975, Catalogue No. 13-549E.

Current transfers:
Current transfers are defined as "transfers of income between transactors. The transfers are made from the current income of the payer and add to the current income of the recipient for such purposes as consumption expenditure" (SNA, Page 231). The main distinction between a transfer payment and the purchase of a good or service is that "there is no direct link between the payments and the services received" in the case of the transfer payment (SNA, Page 105).

Current transfers to business from persons:
This is the non-productive or transfer portion of interest on the consumer debt. It is equal to total interest on the consumer debt less the administrative portion.

Current transfers to government from persons:
Transfers to Government includes "Direct Taxes" and "Other Current Transfers to Government". See the relevant headings for further explanation of these terms.

Current transfers to non-residents from persons:
This inicudes personal remittances to non-resident governments, corporations, and persons.

Current transfers to persons from business:
Payments classified under this heading refer to charitable and other contributions from corporations to persons and unincorporated business and to bad debt allowances, that is "the amounts charged by businesses in respect to doubtful accounts, net of recoveries" (NIEA, Page 113).

Current transfers to persons from government:
An expenditure of the federal, provincial and local governments, these transfers encompass all direct payments from governments to persons. Included in this component are such items as family and youth allowances, unemployment insurance benefits, workers' compensation benefits, general welfare payments, old age security benefits, Canada Pension Plan benefits, and public service pension benefits.

Current transfers to persons from non-residents:
This refers to items such as pensions paid by foreign governments, cash payments by relatives or friends living in other countries, charitable and other contributions made by non-resident corporations.

Depreciation:
Depreciation is the actual wear and tear and obsolescence of fixed capital assets in the process of economic production.

Direct taxes - business enterprises:
This item encompasses three components: general income taxes, mining and logging taxes and other direct taxes. These taxes are levied on profits as opposed to taxes on capital, on place of business or on sales, which are indirect taxes. These taxes are levied against private and government business enterprises and are collected by the federal and provincial governments.

Direct taxes - non-residents:
These are taxes levied by the federal government on payments to non- residents of such items as dividends, interest, royalties, management fees, etc.

Direct taxes - persons:
This component encompasses such items as personal income taxes, employer and employee contributions to social insurance programmes, employer and employee contributions to non-trusteed public service pension plans, and employer and employee contributions to the Canada Pension Plan. Direct taxes are mainly levies assessed against individuals that take some account of ability to pay and are collected by both the federal and provincial governments.

Exports and imports of goods and services:
Exports of goods and services include receipts from exports of merchandise, freight and shipping credits earned, travel expenditures of non-residents in Alberta, and other earnings, especially receipts from business services rendered to non-residents. Imports of goods and services include payments for imports of merchandise, freight and shipping charges incurred, travel expenditures of Albertans in the rest of Canada and abroad, and other payments, especially payments for business services rendered by non-residents. To date, it has not been possible to include Alberta transactions in freight and shipping, and business services with the rest of Canada. Therefore, for these categories, only those transactions with the rest of the world are included.

Factor cost:
Gross Domestic Product at factor cost is a measure of income accruing to the factors of production (land, labour and capital). It does not include income that accrues to the non-factor or invisible components of GDP (see Market Prices). Thus GDP at factor cost is derived from GDP at market prices by subtracting indirect taxes less subsidies, plus residual.

Gross domestic product (GDP) in constant dollars:
This is a measure of total production during a given time frame and a given geographical location which is valued in prices for some base year. For Alberta, the base year used is 1971.

Gross domestic product (GDP) in current dollars:
This refers to the value of total production within a given geographical area for a specific time period, and is measured in prices which prevail during the period being valued. It includes output that is produced by capital stock which is owned by non-residents of the region, but it does not include income received by residents on production which takes place

outside the region. Thus GDP is strictly a measure of production within a specific region, regardless of ownership of the factors of production.

Gross fixed capital formation:
Government and business gross fixed capital formation is defined to include expenditures of government and business for new construction and new machinery and equipment. Expenditures of persons for new residential dwellings are also included, since individuals, in their capacity as home-owners, are treated as business enterprises. Only new construction and new machinery and equipment are included; purchases of land, used buildings, and second-hand machinery and equipment are excluded since they do not represent current production of goods and services.

Gross national (provincial) product (GNP):
As opposed to GDP, this item measures the total value of production attributable to the residents of a given region during a particular time frame, regardless of where that production takes place. Thus GNP at Market Prices equals GDP at Market Prices plus investment income received from non-residents less investment income paid to non-residents.

Gross capital stock:
Gross stocks are the cumulative value of gross investment in capital goods less cumulative discards.

Implicit price indexes:
These are currently - weighted price indexes which measure yearly changes in price as well as changes in expenditure patterns between items. They are calculated by dividing the current dollar values of the components of Gross Domestic Product by their deflated constant dollar series.

Indirect taxes:
These are taxes levied by the federal, provincial and local governments. Indirect taxes represent a part of the market price of goods and services which is not received by factors of production. They are imposed on the production and/or sale of goods and services or they may be levied in accordance with formulae which take account of certain capital holdings (e.g. real property). They may also take the form of charges for the right to engage in certain activities of a personal, professional, industrial or commercial nature. Indirect taxes include such components as manufacturers' sales tax (federal), retail sales taxes (provincial), customs duties, excise duties and taxes (including oil export charges), natural resource taxes, real property taxes, amusement taxes and profits of liquor boards. Indirect taxes, however, exclude the sales of oil and gas rights.

Interest and miscellaneous investment income:
This component includes bond interest, mortgage interest, bank interest, royalties, investment income of life insurance companies, etc. This item is closely linked with investment income of persons, investment income of governments and interest on the public debt. The nature of these linkages is fully explained in National Income and Expenditure Accounts, Chapter 7, Statistics Canada No. 13-549E.

Interest, dividends and miscellaneous investment income of persons:
This category is a measure of the interest income of persons. It includes bank, mortgage and bond interest, both paid and imputed. It also includes royalties received by persons and dividends received on Canadian bond holdings. It does not include interest on the public debt nor interest on the consumer debt. In addition to the above, the investment income of life insurance companies and fraternal organizations is included in the figures. The series takes into account both interest and dividends received from the corporate and government business enterprise sector as well as the non-resident sector of the accounts.

Interest on the public debt:
This is an expenditure of all levies of government and hospitals. It encompasses all payments made in respect of their borrowed funds.

Inventory valuation adjustment:
The inventory valuation adjustment is the difference between the value of physical change in inventory and the change in inventory book value. This adjustment is made to remove, from corporation profits and the net income of unincorporated business, any unrealized gains or losses arising from the effect of price changes on holding of inventories. Since the method of calculating farm income automatically eliminates such gains or losses, this adjustment is required only for business inventories and grain in commercial channels other than the Canadian Wheat Board.

Investment income (government):
A revenue source for the federal, provincial and local governments and hospitals, investment income includes such items as interest on government-held public funds, interest on loans, advances and other investments, royalties and remittances from government enterprises.

Market prices:

Gross Domestic Product at market prices is a concept that measures total production based on the earnings of the factors of production (factor cost) plus the non-factor costs of production (indirect taxes less subsidies). GDP at Market Prices also includes an indirect measure of depreciation called Capital Consumption Allowances. Since this is a measure of production, it does not include transfer payments (see Current Transfers).

Mid-year net capital stocks:

Mid-year net capital stocks are net stocks adjusted to the middle of each year. Net stocks are gross stocks less deductions of losses in value through physical deterioration and obsolescence.

Military pay and allowances:

This includes wages and salaries paid to members of the armed forces as well as supplementary payments such as employer contributions to pension funds. The value of uniforms, free medical examinations, and food supplied to personnel is included for years prior to 1966. The value of the provision of barracks to personnel is not included.

Miscellaneous investment income from non-residents:

Miscellaneous investment income from non-residents includes dividend, interest and business service payments to Alberta businesses. Business service payments include rent, royalties, advertising, research, insurance and management fees. For the provincial accounts there should be two components for payments from non-residents: payments from non-Canadians and payments from Canadians but non-Albertans. Because the data for interprovincial payments are not available at present, the component "payments from Canadians but non-Albertans" is not estimated.

Net income of non-farm unincorporated business including rent:

This item includes the net income of all non-farm unincorporated businesses covering almost every industry in the economy including the net income of independent professional practitioners, such as doctors, dentists, nurses, lawyers and engineers. It also includes the rental incomes of persons.

Net income received by farm operators from farm production:

This item shows cash receipts from the sale of farm products, the imputed value of goods consumed by farm families, supplementary farm payments, and the value of inventory changes (except depreciation on residential dwellings). Negative values occur when the value of depletion of inventories and operating expenses exceeds cash receipts and supplementary payments.

Net provincial income at factor cost:

This is the sum of the earnings of the factors of production, namely, land, labour and capital. It is calculated on a domestic basis since these components are the earnings arising from production within the boundaries of Alberta.

Oil export tax/charge:

In October, 1973, the federal government imposed a tax on the export of crude oil under the Oil Export Tax Act. This Act was in effect until April 1, 1974. Provisions were made within the Act to make payments to the exporting provinces of 50 percent of tax revenues derived from the export tax. The share of each province was based on a production formula. As of April 1, 1974, the tax became a charge on the export of crude oil and certain petroleum products, under the Petroleum Administration Act. Under this Act, no payments were made to the exporting provinces. The oil export tax/charge is included in federal government revenue as an indirect tax.

Other current transfers from persons to government:

A revenue item for the federal, provincial and local governments, these transfers involve direct remittances from persons to government. They are similar to direct taxes, however, the transfer items are not necessarily related to the ability to pay. They also involve less compulsion and greater freedom of choice than direct taxes. Included in this component are such items as motor vehicle licenses and permits (personal purposes only), contributions to hospital and medical care insurance, game licences, marriage licenses and fines and penalties.

Payments to non-residents:

Payments to non-residents include dividend, interest and business service payments. Business service payments include rent, royalties, advertising, insurance, research and management fees. As explained in the item Miscellaneous Investment Income from Non-Residents, only the Payments to Non-Canadians component is estimated. Net payments to Canadians but non-Albertans is derived residually.

Personal disposable income:

This equals personal income minus direct taxes and other current transfers to government by persons.

Personal income:

This is a measure of all income received by Albertans. It includes: wages, salaries and supplementary labour income; military pay and allowances; net income of non-farm unincorporated business; net income received by farm operators from farm production (excluding the adjustment on grain transactions); interest, dividends, and miscellaneous investment income; and all transfer payments received by persons.

Personal savings:

Savings include the value of physical change in farm inventories and the value of personal (non-farm) savings. They also include the change in book value of unincorporated business inventories.

Production:

Production is the creation of goods and services on which members of the community, or the community as a whole, set a dollar value. Any process that creates or adds value to already existing goods is production. For example, the activities of labourers and entrepreneurs who produce and sell the entire range of goods and services; the activities of doctors, lawyers, entertainers, dry cleaners and all who provide services to households and businesses; and the activities of government are all production. They, in various ways, create or improve goods and services, and hence add economic value. Also included in production is "income in kind" which refers to such items as the value of food consumed on farms and the imputed value of free lodging provided by employers. Excluded are illegal activities and the sale of previously owned assets. However, the gain or profit in selling used assests is included in production.

Purchases of goods and services by consumers:

Personal consumer expenditure is broken down into the following categories:

(i) Durable Goods -
This item refers to goods obtained by persons which have an expected long lifetime of use and involve a substantial sum of money to purchase. It includes items such as automobiles, recreation equipment and appliances.

(ii) Non-Durable Goods -
These are "goods with an expected lifetime of less than one year". (SNA, Page 235).

(iii) Semi-Durable Goods -
These are goods which can be used for a period of time of a year or more and do not involve large sums of money to purchase. It includes items such as clothing, footwear, linens and kitchenware.

(iv) Services -
This item covers personal expenditure on a broad variety of services ranging from rent paid and imputed on dwellings to transportation, recreation or personal care services.

Residual:

The final estimate of Gross Domestic Product of each year is taken as the average of the statistical totals of the consolidated income account and the outlay account. That is, the difference between these two independently estimated totals (the residual) is divided into two halves. To produce an arithmetical balance between the two totals, one half of the residual is added to the lower estimate, and one half is subtracted from the higher estimate. The residual also reflects net Alberta receipts in business services, and freight and shipping transactions with the the rest of Canada, as well as flaws in estimation procedures, and discrepancies in the timing with which the income and outlay data are recorded. Persistently positive (or negative) residuals on one side of the accounts may suggest that there is a systematic, built-in, bias in the estimates and/or a persistent deficit (or surplus) in freight and shipping, and in business services transactions with the rest of Canada. Unfortunately, it is at present not possible to identify the sources of bias with any degree of certainty.

Sales to government:

This component consists of the outlays of the federal, provincial and local governments and hospitals for goods and services. It includes general administrative expenses, such as wages and salaries, as well as outlays for goods and other services required in discharging governmental responsibilities. Thus, it consists of purchases from businesses and non-residents, wages and salaries of government employees, medical care expenditures, capital consumption allowances and other miscellaneous outlays.

Sales to persons:

Sales to Persons is a measure of the value of goods and services consumed by the personal sector on a domestic basis. These figures differ from total Personal Expenditure on Consumer Goods and Services in Table 15 by excluding purchases made abroad.

Subsidies:

An expenditure item of the federal and provincial governments, subsidies represent payments made by governments to business toward current costs of production, whether this be at the producer or distributor level. Subsidies may

be made pertaining to agriculture (for example, Canadian Dairy Commission Payments), transportation (such as, payments to railways under the National Transportation Act), and communications, among others.

Supplementary labour income:
This covers payments made by employers on the behalf of employees and can be considered as payment for the services of employees. It includes employers' contributions to unemployment insurance, welfare funds and workers' compensation.

Undistributed corporation profits:
Undistributed corporation profits is the residual after deducting, from corporation profits before taxes, corporation income tax, dividends paid to non-residents, dividends paid to Canadian residents and current transfers to persons.

Value added:
The value added by an industry is the difference between the gross value of production of that industry less the total value of purchases (including imports) of goods and services from other firms which enter into that industry's production process (i.e., the intermediate goods and services). If we sum the value added figures for all industries in Alberta, we would calculate GDP by industry. This method is not used in these accounts.

Value of physical change in inventories:
Value of physical change in inventories is defined as the change in the value of farm and non-farm business inventories (change in physical volume) valued at the average market prices of the period. It is necessary that the new change of business holdings of inventories during the year be included in the Gross Domestic Product to allow for that portion of current production which has not yet been sold (positive change in inventories), or to eliminate that portion of previous year's production which is included in sales of current year (negative change in inventories).

Wages and salaries:
This refers to direct payments other than pensions made to employees. It is calculated before deductions are made for contributions to social security, taxes and so on. It also includes income in kind, such as free lodging. Retroactive payments are included in the period of payment rather than in the period of earning.
